

## 20001 to 20229—Continued.

## 20104. ACANTHOPANAX SESSILIFLORUM.

From Liaoyang, Manchuria. "(No. 379a, June 1, 1906.) An *Aralia*-like shrub growing in the Scottish mission garden in Liaoyang. May be utilized in parks and large gardens; not as ornamental, perhaps, as could be wished for, but apparently very hardy and drought resistant." (*Meyer.*)

## 20105. CRATAEGUS SANGUINEA.

Hawthorn.

From the mountains of northern Korea. "(No. 380a, Aug., 1906.) A very hardy, ornamental *Crataegus* growing as a tall shrub or small tree. Has light green, somewhat tomentose foliage, and is covered in the fall with orange-scarlet berries. The berries are edible, but are rather flat and mealy to our taste. Well adapted for planting in parks." (*Meyer.*)

## 20106. CRATAEGUS SANGUINEA.

Hawthorn.

From the mountains near the source of the Tumen River, northern Korea. "(No. 381a, Aug. 27, 1906.) Seeds from trees growing at high altitudes, over 3,000 feet, and apparently the limit zone of this *Crataegus*. Ought to be harder than No. 380a (S. P. I. No. 20105); otherwise the same description applies to it." (*Meyer.*)

## 20107. CRATAEGUS SANGUINEA.

Hawthorn.

From the mountains of northern Korea. "(No. 382a, Aug. 5, 1906.) A variety bearing yellow berries; not as handsome as the usual type." (*Meyer.*)

## 20108. CRATAEGUS PINNATIFIDA.

Hawthorn.

From the mountains of northern Korea. "(No. 383a, Aug. 28, 1906.) A variety having very finely pinnate leaves. The fruits are much smaller and ripen later than those of the usual type. This may be a distinct variety or strain." (*Meyer.*)

## 20109. CRATAEGUS PINNATIFIDA.

Hawthorn.

From the mountains of northern Korea. "(No. 384a, Aug. 28, 1906.) A variety quite handsome in appearance, having large, glossy, dark green leaves; bears very few fruits, however." (*Meyer.*)

## 20110. SORBUS sp.

From the mountains of northern Korea. "(No. 385a, Aug. 27, 1906.) A *Sorbus* seen usually as a shrub, but in the forests it grows to be a tall, slender tree; apparently a very scant bearer, as I saw only two shrubs in fruit, but the large clusters of yellow berries contrast beautifully with the tender, pinnate foliage." (*Meyer.*)

## 20111. BERBERIS sp.

Barberry.

From the mountains of northern Korea. "(No. 386a, Aug. 28, 1906.) A large-leaved *Berberis* growing 6 to 10 feet tall and bearing many racemes of red berries." (*Meyer.*)

## 20112. BERBERIS sp.

Barberry.

From the mountains of northern Korea. "(No. 387a, Sept. 2, 1906.) A large-leaved *Berberis* from a different locality than the preceding one; otherwise the same remarks apply to it." (*Meyer.*)

## 20113. ROSA sp.

Rose.

From northern Korea. "(No. 388a, Aug., 1906.) Fruits collected from rose bushes in different parts of northern Korea; probably several distinct species." (*Meyer.*)
